

## Design Upgrade BM880

Due to technical advances in cylinder head gasket technology it is sometimes necessary to change the materials used in our products. We have consequently **upgraded the facing material** used for BM880 **from graphite foil to a modern fibre based material**. This will provide greater resistance to the effect of hot oil as well as improved crush resistance under the bore eyelets.

We have also taken the opportunity to **locate the bore shim on the head side of the gasket**. Whilst this will not make any difference to the load balance on the gasket, it will offer a greater resistance to thermal movement of the cylinder head and enhance the gasket durability.

### NEW & IMPROVED

- Greater resistance to thermal movement of the cylinder head
- Enhanced gasket durability
